EXTRACTING FORCEPS (English Pattern)

Extraction Forceps

These forceps will allow you to complete any extraction and work more efficiently even if complications arise. If teeth break during extraction, these are the tools you need to rapidly, safely solve your problems. These forceps have special, all-purpose, jaws designed to cover a broad range of applications and have sharp pointed tips that allow separating the tips of roots from surrounding tissues by lightly twisting them and then securely trapping the extracted roots in the gaps between their jaws.

ROOT ELEVATOR

LUXACUT

Luxacut Luxation Instrument

Over recent years, there has been an increased demand for reduced trauma during extraction procedures. The use of elevators has become widespread for the loosening of teeth before the application of forceps. Luxation instruments tips are more finely tapered than elevators tips. Their characteristics are a combination of a Periotome and an elevator. The sharp tip enables more efficient cutting of the periodontal ligament, whilst the tapering shaft assists with controlled expansion of the bony socket. The extraction operation may be performed with the minimum amount of tissue damage. Healing is therefor quicker and the operation is less distressing for the patient and surgical team alike.

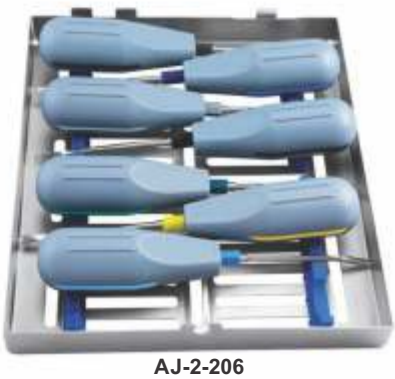

The Luxacut Kit comprises of seven Luxation instruments, a straight, curved, inverted curved & contra blade version in Three different widths. Also available in dual edge blades

- **AJ-2-196**-L2S Straight Blade- Green-2 mm- Apical and/or Interproximal
- **AJ-2-198**-L3C Curved Blade- Black- 3 mm General use/Starter
- **AJ-2-197**-L3S Straight Blade- Grey- 3 mm Interproximal
- **AJ-2-200**-L3CA Contra Angle- Blue- 3 mm Lingual and/or distal-Molars
- **AJ-2-199**-L3IC Inverted Curved- Light Blue- 3 mm- General, Lingual and/or Distal
- **AJ-2-202**-L5C Curved Blade- Brown- 5 mm- Large molar roots- General use

GINGIVAL CORD PACKERS

For atraumatic and accurate cord placement.

AJ-3-378 BN1 — Thin blade and rounded contour facilitates use in both thick and thin tissues without catching or dropping cord. Bilateral notch allows placement in limited access areas.

AJ-3-379 S6 — Ideal blade thickness with angle and blade shapes similar to the IPC carver.

AJ-3-380 CSI-1 Serrated — Also available non-serrated CSI-1 (GCPCSI1NS).

AJ-3-381 113 Serrated — Also available non-serrated 113 (GCP113NS).

AJ-3-382 Balshi — Small and thin non-serrated blade shape.

AJ-3-383 1 Yardley — Round non-serrated working end.

AJ-3-384 7 Guyer Serrated — Also available non-serrated 7 Guyer (GCPG7NS).

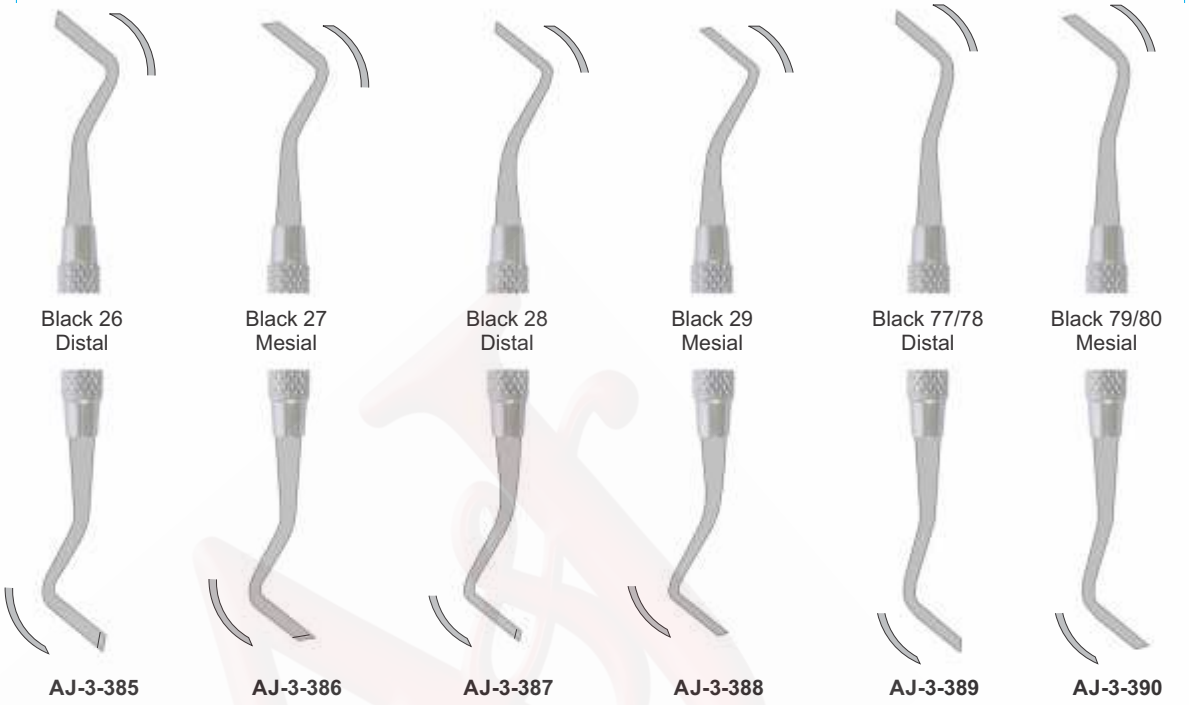

GCPS6 accurate cord placement with minimal tissue trauma

CARVERS INSTRUMENTS

Scaler for reduced interproximal spaces

CARVERS

Used to carve anatomical features and trim excess materials.

AJ-3-416 Inter-proximal — Extremely thin, flexible blade; ideal for interproximal contouring.

AJ-3-417 Inter-proximal Off-Angle — Extremely thin, flexible blade. Off-Angle provides better access to posterior areas.

AJ-3-418 1/2-3 Hollenback — Universal adaptability. Ideal for placing, carving and contouring amalgam.

AJ-3-419 3S Hollenback — Design characteristics similar to 1/2 Hollenback but with slightly larger blades.

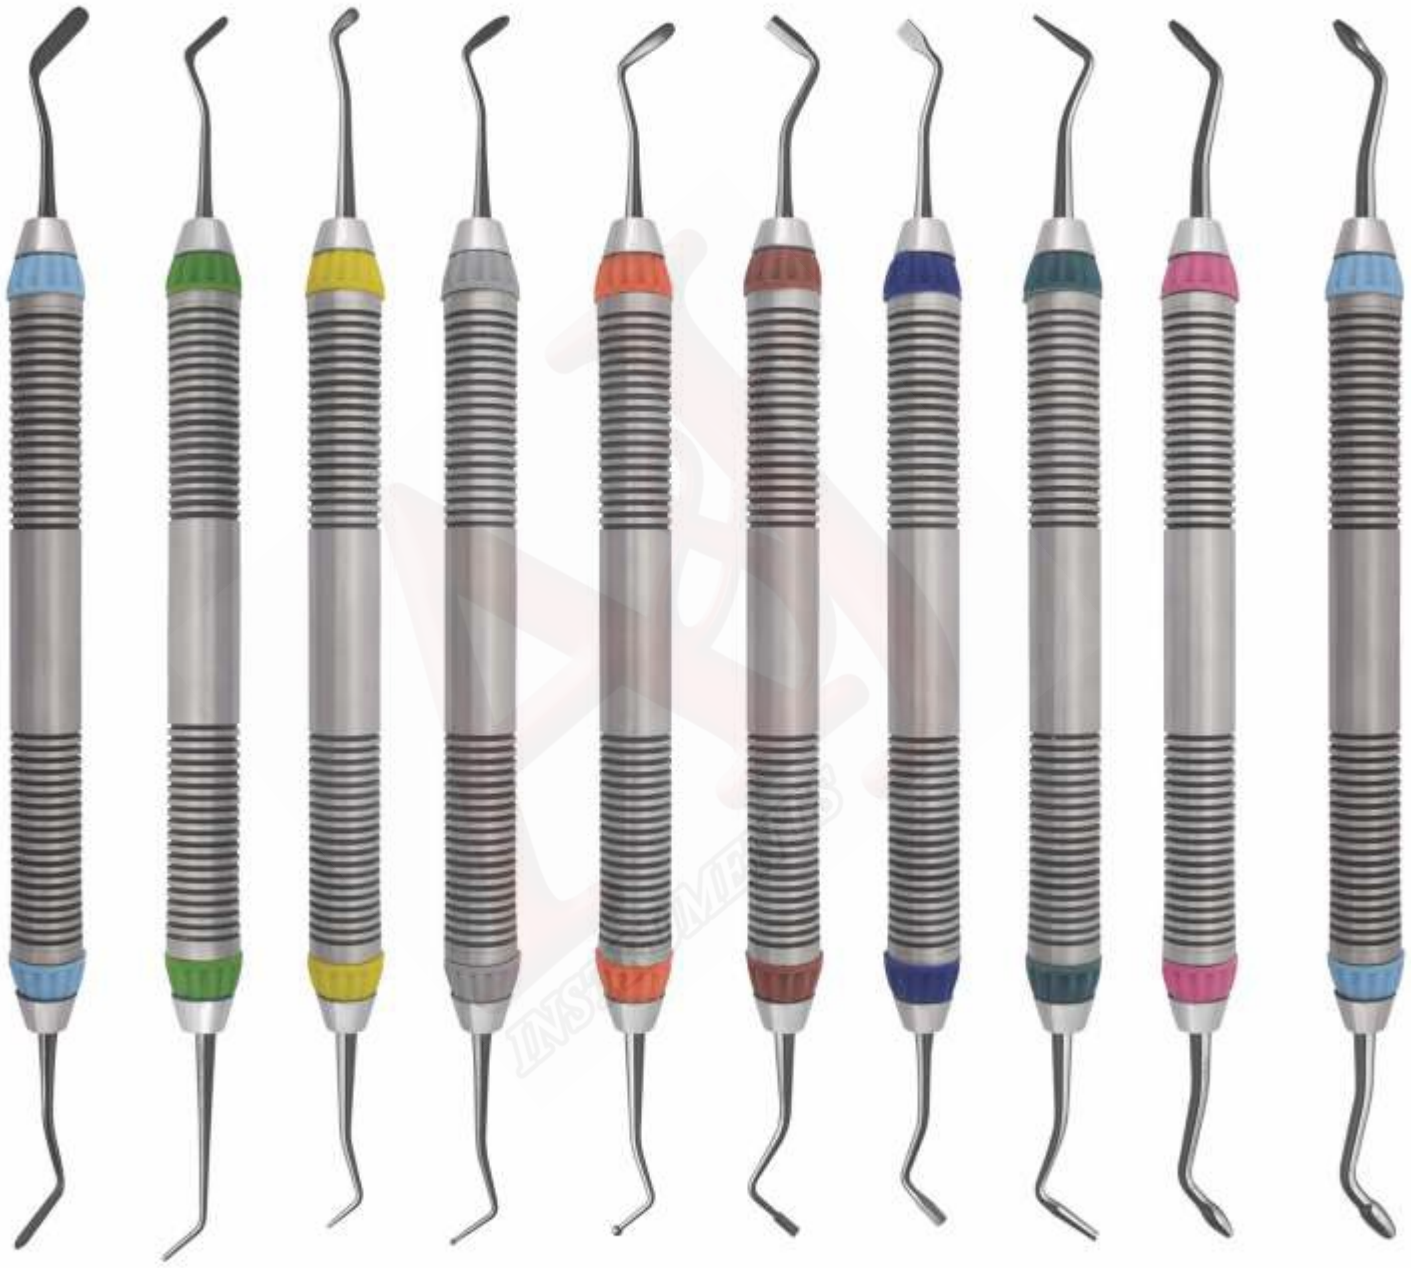

AJ-3-420 3 Hollenback — Design characteristics similar to 1/2-3 Hollenback but with significantly larger blades.

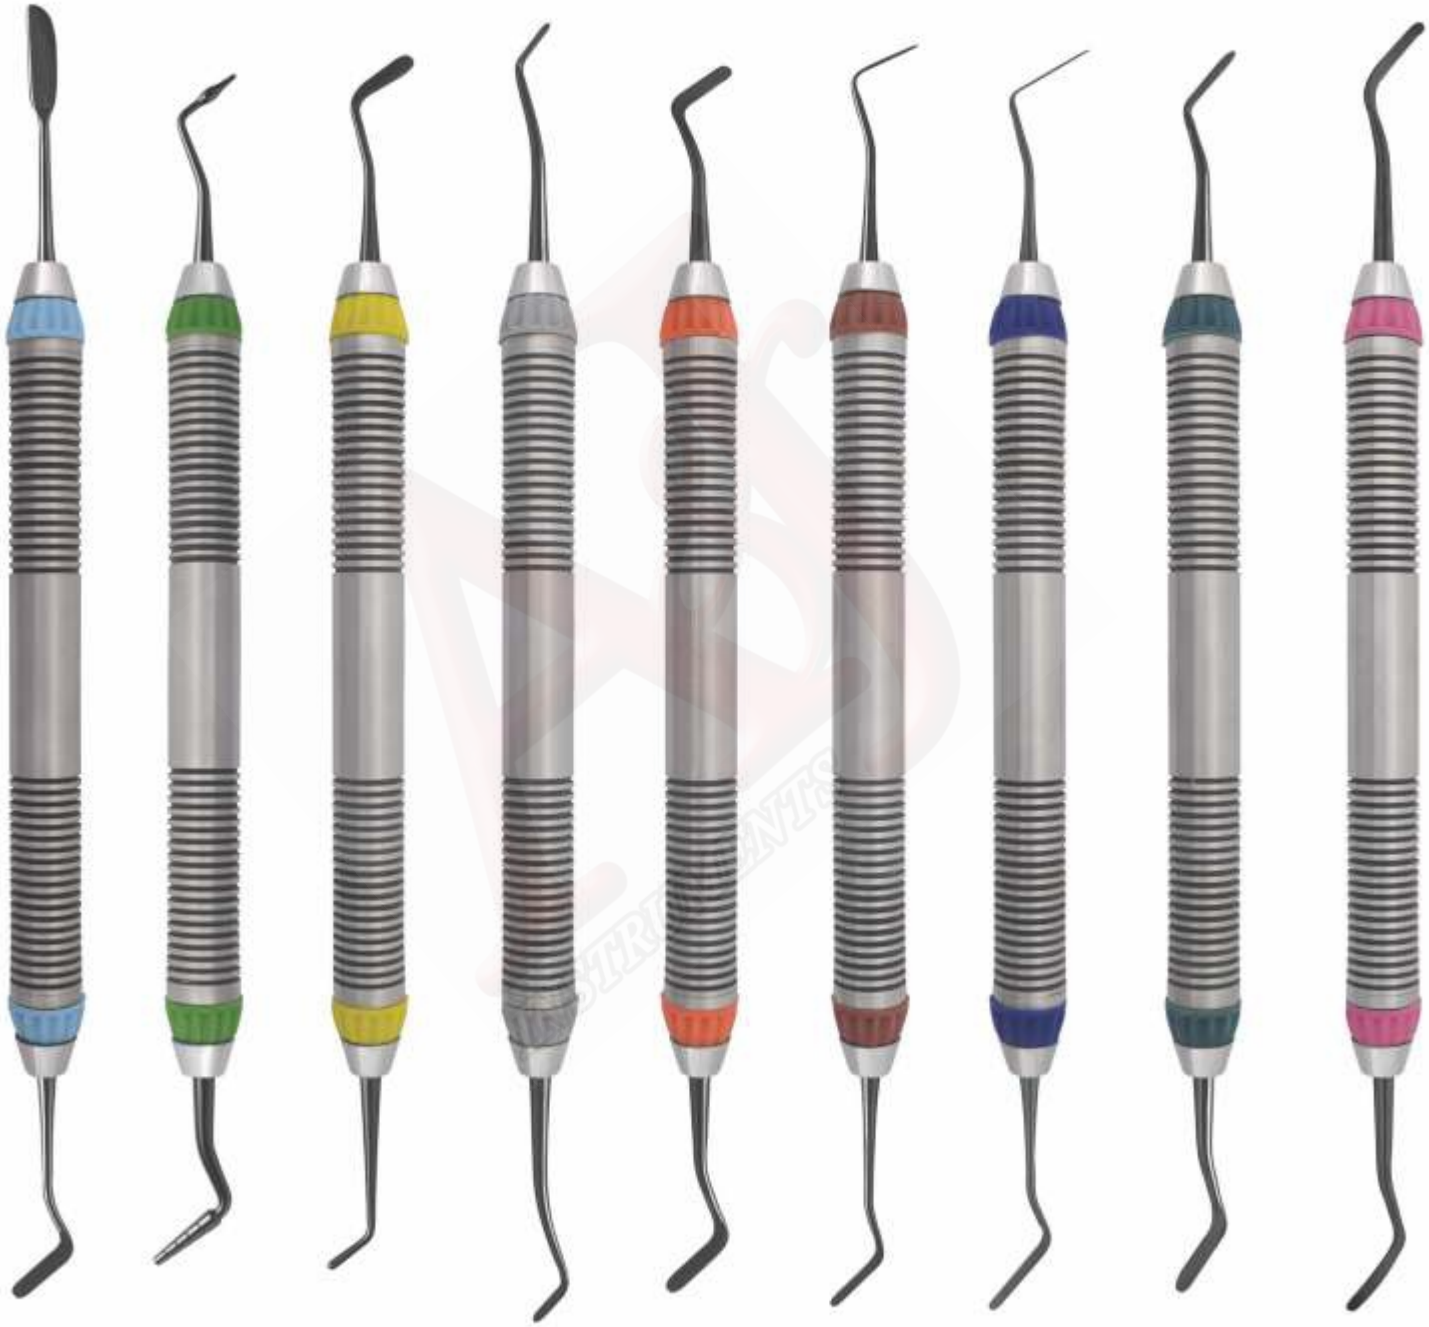

AJ-3-421 8 Wiland Minn.IPC1 — Extremely thin curved blade; ideal for adapting to interproximal surfaces.

- Open-end adjustment wrench # **H**

Precautions

1. To remove crowns placed over pins or screw-type posts, use lowest “strike intensity” to prevent fracture.
2. This instrument could cause damage to the mar - gins of soft gold crowns. If re-use is anticipated, cut a small groove parallel to the lingual margin.
3. Highest strike intensity could cause root fracture; be careful in long span restorations.
4. Only low intensity strike force should be used with teeth having high mobility and little bone support.
5. For highest strike intensity settings, let the individual situation and common sense prevail.

IMPLANTOLOGY

If an implant cannot be set, since the diameter of the jaw is not su fficient, a piece of bone has to be implanted. The additional bone is extracted e.g. from the lower jaw. The bone piece is then locked onto the compound area with the straight forceps (front tooth sector).
